NUMBER: EL818774665US

DATE OF DEPOSIT: June 22, 2001

I hereby certify that this paper or fee is being deposited with the United States Postal Service
"EXPRESS MAIL POST OFFICE TO ADDRESSEE" service under 37 C.F.R. 1.10 on the date
indicated above and is addressed to: Assistant Commissioner for Patents, Washington D.C. 20231.

Signature

1 This application is a continuation-in-part of U.S. patent application No.
2 09/770,848, filed January 26, 2001, which is a continuation of U.S. patent application No.
3 08/862,201 filed May 23, 1997, now U.S. Patent No. 6,218,342 which is a non-
4 provisional that claims the benefit of Provisional Application No. 60/023,043 filed
5 August 2, 1996.

6 BACKGROUND OF THE INVENTION

7 Many types of fluids have been used in the drilling of oil and gas wells. The
8 selection of an oil-based drilling fluid, also known as oil-based mud, involves a careful
9 balance of the both the good and bad characteristics of such fluids in a particular
10 application, the type of well to be drilled and the characteristics of the oil or gas field in
11 which the well is to be drilled. A surfactant capable of emulsifying incorporated water
12 into the oil is an essential component of oil-based muds.

13 The primary benefits of selecting an oil-based drilling fluid include: superior hole
14 stability, especially in shale formations; formation of a thinner filter cake than the filter
15 cake achieved with a water based mud; excellent lubrication of the drilling string and
16 downhole tools; penetration of salt beds without sloughing or enlargement of the hole as
17 well as other benefits that should be known to one of skill in the art.

18 An especially beneficial property of oil-based muds is their excellent lubrication
19 qualities. These lubrication properties permit the drilling of wells having a significant
20 vertical deviation, as is typical of off-shore or deep water drilling operations or when a
21 horizontal well is desired. In such highly deviated holes, torque and drag on the drill
22 string are a significant problem because the drill pipe lies against the low side of the hole,
23 and the risk of pipe sticking is high when water based muds are used. In contrast oil-
24 based muds provide a thin, slick filter cake which helps to prevent pipe sticking and thus
25 the use of the oil based mud can be justified.

26 Despite the many benefits of utilizing oil-based muds, they have disadvantages.
27 In general the use of oil based drilling fluids and muds has high initial and operational
28 costs. These costs can be significant depending on the depth of the hole to be drilled.
29 However, often the higher costs can be justified if the oil based drilling fluid prevents the
30 caving in or hole enlargement which can greatly increase drilling time and costs. Disposal

of oil-coated cuttings is another primary concern, especially for off-shore or deep-water drilling operations. In these latter cases, the cuttings must be either washed clean of the oil with a detergent solution which also must be disposed of, or the cuttings must be shipped back to shore for disposal in an environmentally safe manner. Another consideration that must be taken into account is the local governmental regulations that may restrict the use of oil based drilling fluids and muds for environmental reasons.

Oil-based muds contain some water, either formed in the formulation of the drilling fluid itself, or residual water in the hole, or intentionally added water to affect the properties of the drilling fluid or mud. In such water-in-oil type emulsions, also known as invert emulsions, an emulsifier is utilized that will stabilize the emulsion. In general, the invert emulsion may contain both water soluble and oil soluble emulsifying agents. Typical examples of such emulsifiers include polyvalent metal soaps, fatty acids and fatty acid soaps, and other similar suitable compounds that should be known to one of skill in the art. The use of traditional emulsifiers and surfactants in invert drilling fluid systems can complicate the clean up process in open hole completion operations. Fluids using traditional surfactant and emulsifier materials may require the use of solvents and other surfactant washes to penetrate the filter cake and reverse the wettability of the filter cake particles. That is to say the washing with detergents should convert the oil-wet solids of the filter cake into water-wet solids. Water-wet solids in the filter cake are necessary so that the subsequent acid wash can attack the particles of the mud cake and destroy or remove them prior to production. The productivity of a well is somewhat dependent on effectively and efficiently removing the filter cake while minimizing the potential of water blocking, plugging or otherwise damaging the natural flow channels of the formation. The problems of efficient well clean-up, stimulation, and completion are a significant issue in all wells, and especially in open-hole horizontal well completions.

A typical horizontal well completion process includes one or more of the following: drilling the horizontal section utilizing an oil-based drilling fluid; smoothing directional corrections with a hole opener; displacing the open hole section with an unused drill-in fluid to minimize solids exposed to the completion assembly; running the completion assembly in to the horizontal well; displacing the drill-in fluid with a

completion brine; washing the filter cake with solvents and surfactants to remove or wash away the oil-based drilling fluid; destroying the filter cake with an acid soak; and, commencing production. Extension of the time required to clean up the open hole well can result in wellbore instability and possible collapse. The collapse of a well is generally considered a bad occurrence because the well will then have to be redrilled or opened up if production from the formation is to occur. Thus the stability of the open-hole well limits the number of steps performed before commencing production. Thus there is a tradeoff between increased production due to a fully cleaned-up well bore and the potential of well collapse due to instability.

In view of the above there exists an unmet need for an oil-based drilling fluid or mud emulsion that can easily be broken in the presence of the acid soak solution. Such a fluid would allow a decrease in the number of steps involved in removing the filter cake and cleaning up the well which minimizes the risk of well collapse. In addition such a fluid would allow for a more thorough and complete cleaning up of the well thus increasing the production of the well.

SUMMARY OF THE INVENTION

Surprisingly, a novel invert emulsion fluid useful in the drilling, completing or working over of a subterranean well has been invented in which the emulsion can be readily and reversibly converted from a water-in-oil type emulsion to a oil-in water type emulsion. In one particular embodiment, the invert emulsion fluid includes an oleaginous fluid, a non-oleaginous fluid and an amine surfactant having the structure

wherein R is a C₁₂ to C₂₂ group, R' is independently selected from H, or C₁ to C₃ alkyl; A is NH or O and the sum of x and y is greater or equal to one but less than or

1 emulsions, the oleaginous fluid is the dispersed phase and the non-oleaginous fluid is
2 the continuous phase. However, "invert emulsions" in which the non-oleaginous fluid
3 is the dispersed phase and the oleaginous fluid is the continuous phase, can be formed
4 upon the use of a suitable emulsifier. One of skill in the art should appreciate that the
5 chemical properties of the emulsifier are important in the selection of a suitable
6 emulsifier to form a stable invert emulsion.

7 The present invention is generally directed to an invert emulsion fluid that is
8 useful in the drilling, completing and working over of subterranean wells, preferably
9 oil and gas wells. Such uses of invert emulsion fluids in such application should be
10 known to one of skill in the art as is noted in the book COMPOSITION AND
11 PROPERTIES OF DRILLING AND COMPLETION FLUIDS, 5th Edition, H.C.H.
12 Darley and George R. Gray, Gulf Publishing Company, 1988, the contents of which
13 are hereby incorporated herein by reference.

14 In one embodiment of the present invention, the invert emulsion fluid includes an
15 oleaginous fluid, an non-oleaginous fluid and an amine surfactant. The surfactant
16 component is selected so as to provide the unexpected and unobvious results substantially
17 described herein. When a majority of the amine is in its unprotonated form, an invert
18 emulsion may be formed in which the oleaginous liquid is the continuous phase and the
19 non-oleaginous liquid is the discontinuous phase. That is to say, the unprotonated form
20 of the amine surfactant is able to stabilize an invert emulsion. Upon addition of a
21 protonating agent, herein referred to as an acid, that is capable of protonating a major
22 portion of the amine surfactant, the oleaginous liquid becomes the discontinuous phase
23 and the non-oleaginous liquid become the continuous phase. In other words, the invert
24 emulsion is converted to a regular emulsion upon the addition of acid and the protonation
25 of the amine surfactant. Further, upon addition of a deprotonating agent, herein referred
26 to as a base, that is capable of deprotonating a major portion of the protonated amine
27 surfactant, an invert emulsion may be again formed; that is, the invert emulsion of the
28 present invention is reversible to an oil-in-water emulsion, and back.

29 The oleaginous fluid of the present invention is a liquid and more preferably is a
30 natural or synthetic oil and more preferably the oleaginous fluid is selected from the

1 group including diesel oil; mineral oil; a synthetic oil, such as polyolefins,
 2 polydiorganosiloxanes, siloxanes or organosiloxanes; and mixtures thereof. The
 3 concentration of the oleaginous fluid should be sufficient so that an invert emulsion forms
 4 and may be less than about 99% by volume of the invert emulsion. In one embodiment
 5 the amount of oleaginous fluid is from about 30% to about 95% by volume and more
 6 preferably about 40% to about 90% by volume of the invert emulsion fluid. The
 7 oleaginous fluid in one embodiment may include at least 5% by volume of a material
 8 selected from the group including esters, ethers, acetals, dialkylcarbonates, hydrocarbons,
 9 and combinations thereof.

10 The non-oleaginous fluid used in the formulation of the invert emulsion fluid of
 11 the present invention is a liquid and preferably is an aqueous liquid. More preferably, the
 12 non-oleaginous liquid may be selected from the group including sea water, a brine
 13 containing organic and/or inorganic dissolved salts, liquids containing water-miscible
 14 organic compounds and combinations thereof. The amount of the non-oleaginous fluid is
 15 typically less than the theoretical limit needed for forming an invert emulsion. Thus in
 16 one embodiment the amount of non-oleaginous fluid is less than about 70% by volume
 17 and preferably from about 1% to about 70% by volume. In another embodiment, the non-
 18 oleaginous fluid is preferably from about 5% to about 60% by volume of the invert
 19 emulsion fluid.

20 The selection of a suitable amine surfactant useful in the present invention is
 21 accomplished by combining an amount of the unprotonated amine with portions of the
 22 oleaginous fluid and non-oleaginous fluid in a suitable container. The fluid is then
 23 vigorously agitated or sheared so as to intimately mix the two fluids. Upon stopping of
 24 the mixing, visual observation will determine if an emulsion has formed. An emulsion is
 25 considered stable if the oleaginous and the non-oleaginous fluids do not substantially
 26 separate after agitation. That is to say the emulsion will last for more than about 1
 27 minute after the halting of the agitating or shearing motion that formed the emulsion.
 28 One test of whether or not an invert emulsion has formed is to take a small portion of the
 29 emulsion and place it in a container of the oleaginous fluid. If an invert emulsion is
 30 formed, the drop of emulsion will disperse in the oleaginous fluid. An alternative test is

to measure the electrical stability of the resulting emulsion using an commonly available emulsion stability tester. Generally in such tests, the voltage applied across two electrodes is increased until the emulsion breaks and a surge of current flows between the two electrodes. The voltage required to break the emulsion is regarded in the art as a measure of the stability of the emulsion. Such tests of emulsion stability should be well known to one of skill in the art as is evidenced by described on page 166 of the book COMPOSITION AND PROPERTIES OF DRILLING AND COMPLETION FLUIDS, 5th Edition, H.C.H. Darley and George R. Gray, Gulf Publishing Company, 1988, the contents of which are hereby incorporated herein by reference.

In view of the above selection criteria, in one embodiment of the present invention the amine surfactant should have the general formula

wherein R is C₁₂-C₂₂; R' is independently selected from hydrogen or C₁ to C₃ alkyl group; A is NH or O, and x+y has a value greater than or equal to one but also less than or equal to three. Preferably the R group may be a C₁₂-C₂₂ aliphatic hydrocarbon and more preferably is a non-cyclic aliphatic. In one embodiment the R group contains at least one degree of unsaturation that is to say at least one carbon-carbon double bond. In another embodiment the R group may be a commercially recognized mixture of aliphatic hydrocarbons such as soya, which is a mixture of C₁₄ to C₂₀ hydrocarbons, or tallow which is a mixture of C₁₆ to C₂₀ aliphatic hydrocarbons, or tall oil which is a mixture of C₁₄ to C₁₈ aliphatic hydrocarbons. In another embodiment, one in which the A group is NH, the value of x+y is preferably two with x having a preferred value of one. In yet another embodiment in which the A group is O, the preferred value of x+y is two with the value of x being preferably one. Preferred examples of commercially available amine surfactants include Ethomeen T/12 a diethoxylated tallow amine; Ethomeen S/12 a

1 diethoxylated soya amine; Duomeen O a N-oleyl-1,3-diaminopropane, Duomeen T a N-
2 tallow-1,3-diaminopropane, all of which are available from Akzo.

3 The amount of amine surfactant present in the invert emulsion fluid of the present
4 invention, as noted above, should be sufficient to stabilize the invert emulsion according
5 to the above noted test. That is to say the emulsion will last for more than about 1
6 minute after the halting of the agitation or shearing motion that forms the emulsion.
7 While the concentration may vary depending on the particular components in the
8 drilling fluid or mud, typically the concentration is less than about 10 % by volume of
9 the fluid. Thus in one embodiment the amine surfactant is preferably present in the
10 invert emulsion fluid at a concentration of 0.1% to 5.0%. More preferably the amount of
11 amine surfactant present should be present in a concentration of 1 to 5% by volume of the
12 fluid.

13 As previously noted above, it has been unexpectedly found that the addition of a
14 protonating agent causes the conversion of the invert emulsion, that is to say a water-in-
15 oil type emulsion, into a regular or conventional emulsion, that is to say an oil-in-water
16 type emulsion. The protonating agent, herein referred to as an "acid", must be
17 functionally capable of protonating the amine surfactant. Further, the acid should be of
18 sufficient strength to protonate the amine surfactant so as to cause the conversion of the
19 emulsion from an invert emulsion to a regular emulsion. In one embodiment this amount
20 is greater than about 1 equivalent of acid and preferably is about 0.1 to about 5
21 equivalents. Compounds that are suitable for use as an acid include, mineral acids and
22 organic acids preferably soluble in water. Preferred mineral acids include hydrochloric
23 acid, sulfuric acid, nitric acid, phosphoric acid, hydrofluoric acid, hydrobromic acid and
24 the like. Preferred organic acids include citric acid, tartaric acid, acetic acid, propionic
25 acid, glycolic acid, lactic acid, halogenated acetic acids, butyric acid, organosulfonic
26 acids, organophosphoric acids, and the like. Compounds that generate acid upon
27 dissolution in water may also be used, for example, acetic anhydride, hydrolyzable esters,
28 hydrolyzable organosulfonic acid derivatives, hydrolyzable organophosphoric acid
29 derivatives, phosphorus trihalide, phosphorous oxyhalide, anhydrous metal halides, sulfur
30 dioxide, nitrogen oxides, carbon dioxide, and similar such compounds. Typically, fatty

1 acids should be avoided or used in small amounts so as to not interfere with the
2 reversibility of the amine surfactant system.

3 In yet another embodiment of the present invention, other surfactant compounds
4 may be used in conjunction with the amine surfactants utilized herein. In such cases it is
5 important however that the quantity and nature of these supplemental surfactants not
6 interfere in the ability and properties given the emulsion fluid by the amine surfactant to
7 act as described herein.

8 The method used in preparing the drilling fluids of the present invention is not
9 critical. Conventional methods can be used to prepare the drilling fluids of the present
10 invention in a manner analogous to those normally used, to prepare conventional oil-
11 based drilling fluids. In one representative procedure, a desired quantity of oleaginous
12 fluid such as a base oil and a suitable amount of amine emulsifier are mixed together and
13 the remaining components are added sequentially with continuous mixing. An invert
14 emulsion of the present invention is formed by vigorously agitating, mixing or shearing
15 the oleaginous fluid and the non-oleaginous fluid.

16 The fluids of the present invention may further contain additional chemicals
17 depending upon the end use of the invert emulsion so long as they do not interfere with
18 the reversibility of the invert emulsion fluids described herein. For example, wetting
19 agents, organophilic clays, viscosifiers, weighting agents, bridging agents and fluid loss
20 control agents may be added to the fluid compositions of this invention for additional
21 functional properties. The addition of such agents should be well known to one of skill in
22 the art of formulating drilling fluids and muds. However, it should be noted that the
23 addition of such agents should not adversely interfere with the properties imparted by
24 the amine surfactant as described herein.

25 Wetting agents that may be suitable for use in this invention include, crude tall
26 oil, oxidized crude tall oil, surfactants, organic phosphate esters, modified imidazolines
27 and amidoamines, alkyl aromatic sulfates and sulfonates, and the like, and combinations
28 or derivatives of these. However, the use of fatty acid wetting agents should be
29 minimized so as to not adversely effect the reversibility of the invert emulsion disclosed
30 herein. Versawet® and Versawet®NS are examples of commercially available wetting

1 invention include modified lignites, asphaltic compounds, gilsonite, organophilic
2 humates prepared by reacting humic acid with amides or polyalkylene polyamines, and
3 other non-toxic fluid loss additives. Typically, fluid loss control agents are added in
4 amounts less than about 10% and preferably less than about 5% by weight of the fluid.

5 Because many of properties of the invert emulsion of the present invention are
6 similar to those of conventional invert emulsions, the application of the fluids should be
7 straightforward.

8 One unexpected and unobvious aspect of drilling subterranean wells with the
9 invert emulsion of the present invention is that well clean-up and well stimulation are
10 much easier and quicker to carry out, especially when the well penetrates or comes into
11 contact with a producing formation. As described above, when a conventional invert
12 emulsion drilling fluid is used, cleaning up and stimulating the well may include washing
13 the filter cake with detergents and an acid wash to dissolve the filter cake particles. If
14 these operations are to be fully effective, a significant amount of aqueous detergent and
15 aqueous acid may penetrate the formation resulting in water blockages in the formation
16 which adversely affect production.

17 In addition, time is of the essence when open hole operations such as logging are
18 being conducted because the hole can collapse unexpectedly. Thus, in one embodiment
19 of the present invention is a method of logging a well using conventional well logging
20 tools by first drilling the well with the invert emulsion, reversing the invert emulsion to a
21 regular emulsion, logging the well and then reversing back the regular emulsion fluid to
22 an invert emulsion so that drilling operation can resume. When the fluid comes into
23 contact with a producing formation a filter cake is formed in a conventional manner.
24 However, instead of washing the hole with a detergent solution prior to acid washing, the
25 use of the drilling fluid of the present invention allows for the use of only an acid
26 containing washing solution. Thus, the acid in the acid washing solution, the acid being
27 functionally able to protonate the amine surfactant, is injected into the well so as to
28 convert the emulsion on the filter cake which initially is a water-in-oil type emulsion, into
29 an oil-in-water type emulsion. The acid protonates the amine and the previously oil-wet
30 particles of the filter cake thereby become water-wet allowing the acid to readily reach

1 acid being functionally able to protonate the amine surfactant and being in sufficient
 2 quantities so as to convert the invert emulsion to a regular emulsion. That is to say, the
 3 addition of the acid protonates the amine surfactant and the water-in-oil type emulsion
 4 utilized in drilling the well is converted into a oil-in-water type emulsion. Solids, now
 5 substantially water-wet, may now be separated from the fluid by gravity or mechanical
 6 means for further processing or disposal. The fluid may then be mixed with a base, the
 7 base being functionally able to deprotonate the protonated amine surfactant. The base
 8 should be in sufficient quantities so as to convert the oil-in-water type emulsion formed
 9 upon the addition of acid, back to a water-in-oil emulsion. The resulting water-in-oil
 10 emulsion may then be used as it is or reformulated into a drilling fluid suitable for the
 11 drilling conditions in another well.

12 The fluids of the present invention may also be utilized in well activities other
 13 than simply drilling the well. For example the fluids of the present invention can be used
 14 in the electrical logging, gravel packing, formation fracturing, well completion, well
 15 reworking and other similar type operations where it would be advantageous. Such uses
 16 are contemplated and thus considered within the scope of the present invention. In
 17 carrying out such operations, one of skill in the art should appreciate the specific details
 18 involved in each operation.

19 Thus, one illustrative embodiment of the present invention includes a method of
 20 electrically logging a subterranean well. Such an illustrative method includes drilling the
 21 subterranean well with an invert emulsion drilling fluid. The invert emulsion should be
 22 formulated in accordance with the present invention. That is to say, the fluid includes: an
 23 oleaginous fluid; a non-oleaginous fluid; and an amine surfactant having the structure
 24

25
 26

1 wherein R is a C₁₂-C₂₂ aliphatic hydrocarbon; R' is an independently selectable from
2 hydrogen or C₁ to C₃ alkyl; A is NH or O, and 1 ≤ x+y ≤ 3. In carrying out the illustrative
3 method acid is added to the invert emulsion drilling fluid in a sufficient amount to
4 reverse the filtercake solids from being oil-wet to being water-wet. The well is then
5 electrically logged. In one preferred embodiment of such a method, the oleaginous fluid
6 includes from 5 to about 100% by volume of the oleaginous fluid of a material selected
7 from a group consisting of esters, ethers, acetals, di-alkylcarbonates, hydrocarbons, and
8 combinations of these and similar such compounds useful as the continuous phase in an
9 invert emulsion. It is also preferred that the non-oleaginous liquid is an aqueous liquid
10 and more preferably the aqueous liquid is selected from the group consisting of sea water,
11 a brine containing organic or inorganic dissolved salts, a liquid containing water-miscible
12 organic compounds, and combinations thereof. In one preferred embodiment of the
13 present illustrative method, the amine surfactant is selected from diethoxylated tallow
14 amine; diethoxylated soya amine; N-aliphatic-1,3-diaminopropane wherein the aliphatic
15 group is a C₁₂ to C₂₂ hydrocarbon; or combinations of these.

16 The fluids of the present invention can also be utilized in the reinjection disposal
17 of drill cuttings. Generally the method of disposing of drill cuttings by injection includes
18 the separation of the drill cuttings from the drilling fluid, grinding or slurrification of the
19 drill cuttings in a liquid medium and then injection of the slurry into a subterranean
20 formation that is the target of the disposal operation. The methods and techniques of
21 such disposal processes should be well known to one of skill in the art. The following
22 U.S patents are representative of the methods and other potential uses for the fluids of the
23 present invention: 4942929; 5129469; 5226749; 5310285; 5314265; 5405224; 5589603;
24 5961438; 5339912; 5358049; 5405223; 5589603; 5662169; and 6106733; and 6119779,
25 all of the contents of each of these patents being incorporated by reference into the
26 present disclosure. In such an illustrative method drill cuttings are collected, ground into
27 a slurry and injected into a downhole area of a subterranean well. As contemplated with
28 the fluids of the present invention, such an illustrative method includes: collecting the
29 drilling cuttings from a subterranean well drilled with an invert emulsion drilling fluid.
30 This can be carried out in a conventional manner using cuttings separators and shakers.

1 The invert emulsion drilling fluid used to drill the well includes: an oleaginous fluid; a
2 non-oleaginous fluid; an amine surfactant having the structure
3

4
5
6 wherein R is a C₁₂-C₂₂ aliphatic hydrocarbon; R' is an independently selectable from
7 hydrogen or C₁ to C₃ alkyl; A is NH or O, and 1 ≤ x+y ≤ 3. The illustrative method also
8 includes adding acid to said drilling cuttings so as to change the drilling cuttings from
9 being oil wet to being water wet and grinding and suspending said cuttings in an aqueous
10 based injection fluid. This slurry or suspension of cuttings in injecting fluid is injected
11 into a disposal zone in a subterranean well.

12 Another illustrative embodiment of the present invention includes a method of
13 gravel packing a downhole area of a subterranean well using the fluids of the present
14 invention as the carrier fluid for the gravel packing material. In one illustrative
15 embodiment of such a method, a mixture of a gravel packing material and an invert
16 emulsion drilling fluid is formed. The invert emulsion fluid is used as the carrier fluid
17 that is to say the fluid that carries the solid gravel packing materials downhole. As noted
18 above the fluids of the present invention are formulated such that they include: an
19 oleaginous fluid; a non-oleaginous fluid; an amine surfactant having the structure
20

21
22
23 wherein R is a C₁₂-C₂₂ aliphatic hydrocarbon; R' is an independently selectable from
24 hydrogen or C₁ to C₃ alkyl; A is NH or O, and 1 ≤ x+y ≤ 3;

Upon formation of the mixture, the mixture is injected into a subterranean well so as to gravel pack the downhole area. Such packing is preferably done in slug fashion. The invert emulsion can then be converted to a regular emulsion by adding acid to the fluid so as to change the invert emulsion drilling fluid into a regular emulsion. When this occurs, this also converts the oil-wet gravel solids into water-wet solids. After converting the invert emulsion into a regular emulsion, the gravel pack can be washed to remove any fine particles that would other clog the pore of the gravel pack. Preferably such washing is carried out with an aqueous based wash solution.

The present invention also encompasses a method of fracturing a subterranean formation, in which the subterranean formation is in fluid communication with the surface via a well. Such an illustrative embodiment includes: injecting a fracturing fluid into said well; pressurizing said fluid so as to cause the subterranean formation to fracture and allow the propanant materials to enter said fracture; adding acid to said fluid so as to change the oil-wet propanant materials into water-wet propanant materials and; washing said well with an aqueous based wash solution. the fracturing fluid of such an illustrative embodiment includes: an oleaginous fluid; and an amine surfactant having the structure

wherein R is a C₁₂-C₂₂ aliphatic hydrocarbon; R' is an independently selectable from hydrogen or C₁ to C₃ alkyl; A is NH or O, and 1 ≤ x+y ≤ 3; and oil-wet propanant material.

One specific embodiment of the present illustrative embodiment includes an oleaginous fluid comprising from 5 to about 100% by volume of the oleaginous fluid of a material selected from a group consisting of esters, ethers, acetals, di-alkylcarbonates, hydrocarbons, and combinations thereof. In another illustrative embodiment, the fracturing fluid further includes a non-oleaginous liquid, preferably the non-oleaginous liquid is selected from sea water, a brine containing organic or inorganic dissolved salts, a

liquid containing water-miscible organic compounds, and combinations thereof. It is preferred that the amine surfactant is selected from diethoxylated tallow amine; diethoxylated soya amine; N-aliphatic-1,3-diaminopropane wherein the aliphatic group is a C₁₂ to C₂₂ hydrocarbon; or combinations of these compounds. It is also preferred that the propanant material is selected from quartz gravel, sand, glass beads, ceramic pellets, and combinations of these and similar propanant materials known in the art.

The following examples are included to demonstrate preferred embodiments of the invention and to illustrate the fluid formulations of the present invention. It should be appreciated by those of skill in the art that the techniques and compositions disclosed in the examples which follow represent techniques discovered by the inventors to function well in the practice of the invention, and thus can be considered to constitute preferred modes for its practice. However, those of skill in the art should, in light of the present disclosure, appreciate that many changes can be made in the specific embodiments which are disclosed and still obtain a like or similar result without departing from the spirit and scope of the invention.

General Information Relevant to the Examples

These tests were conducted in accordance with the procedures in API Bulletin RP 13B-2, 1990. The following abbreviations are sometimes used in describing the results of experimentation.

"PV" is plastic viscosity which is one variable used in the calculation of viscosity characteristics of a drilling fluid, measured in centipoise (cp) units.

"YP" is yield point which is another variable used in the calculation of viscosity characteristics of drilling fluids, measured in pounds per 100 square feet (lb/100 ft²).

"AV" is apparent viscosity which is another variable used in the calculation of viscosity characteristic of drilling fluid, measured in centipoise (cp) units.

"GELS" is a measure of the suspending characteristics, or the thixotropic properties of a drilling fluid, measured in pounds per 100 square feet (lb/100 ft²).

"API F.L." is the term used for API filtrate loss in milliliters (ml).

"HTHP" is the term used for high temperature high pressure fluid loss, measured in milliliters (ml) according to API bulletin RP 13 B-2, 1990.

Example-1

Invert-drilling fluids are prepared according to the following formulations with an oleaginous fluid to non-oleaginous fluid-ratio of 70/30. All the materials are in grams.

Formulations

Material	Mud 1	Mud 2	Mud 3

Ethomeen T/12	-	-	10.0
25% CaCl ₂ Brine	90	90	90
CaCO ₃	293	293	293

In the above table, I.O. C₁₆-C₁₈ is an isomerized olefin available from Amoco; VG-PLUS is an organophilic clay available from MI Drilling Fluids; NOVAMUL is an amidoamine surfactant available from M. I. Drilling Fluids; Emphos PS 2227 is a phosphate ester surfactant available from Witco Chemicals; Ethomeen T/12 is an ethoxylated tallow amine available from Akzo Chemicals; and all other components are technical grade chemicals commonly available.

The following general procedure was used in mixing the mud formulations: First the oil (IO-C₁₆-C₁₈), lime and organophilic clay were mixed for 15 min. on a Hamilton Beach Mixer in a suitable mixing jar. Emulsifier was added and the combination was further mixed for 10 min. The calcium-chloride brine was then added and mixed for 15 min. The weight material (CaCO₃) was added and then jar contents were mixed for 20 min. The initial and heat aged fluid properties were measured at the indicated temperatures.

The following rheologies were measured at room temperature after the above formulated fluids were heat aged at 150° F for 16 hours:

	Mud 1	Mud 2	Mud 3
Plastic Viscosity (PV)	44	36	41
Yield Point (YP)	13	4	28
Gel Strength			
10 sec.	6	3	8
10 min.	8	5	12
Electrical Stability (E.S.)	516	303	244

The above fluids were further heat aged at 250° F for 16 hours. Upon cooling, the fluids were mixed for 15 min. and the following rheological properties were measured at room temperature:

	Mud-1	Mud-2	Mud-3
Plastic Viscosity (PV)	49	45	51
Yield Point (YP)	32	4	39
Gels			
10 sec.	15	2	16
10 min.	15	3	21
Electrical Stability (E.S.)	552	205	322

Upon review of the above results, one of skill in the art should understand that stable drilling fluid formulations can be prepared utilizing amine emulsifiers of the present invention.

Each mud formulation was treated with 10.0 ml of 17.5% hydrochloric acid solution and stirred for an additional 10 min. Mud 1 and mud 2 remained invert oil-base muds as indicated by measured electrical stabilities of 453 and 359 respectively. However, mud 3 formulated in accordance with this invention, was converted so that the non-oleaginous fluid, in this case brine, became the continuous phase and the oleaginous fluid became the internal phase. As a result the mud became thick. The water-continuous phase was indicated by a measured electrical stability of seven and the fluid was dispersible in water.

One of ordinary skill in the art should understand and appreciate that the above results indicate that conventional emulsifiers can not be readily converted to water-base mud upon the addition of acid. However, the amine emulsifier of this invention upon

In the above table the terms and abbreviations are the same as in Example 1. In addition the terms Ethomeen S/12 is an ethoxylated soya amine available from Akzo Duomeen O is a N-oleyl-1,3-diaminopropane available from Akzo Chemical; Duomeen T is a N-tallow-1,3-diaminopropane available from Akzo; and all other components are technical grade chemicals commonly available.

The above mud formulation were mixed according to the general procedure described previously in Example 1. The following initial properties were measured at room temperature.

	Mud 4	Mud 5	Mud 6	Mud 7	Mud 8
P.V.	43	42	32	35	42
YP.	12	19	4	9	21
Gels					
10 Sec.	5	6	2	5	8
10 Min.	7	8	3	6	10
E.S.	880	496	727	452	150

The above muds were heat aged at 150°F for 16 hours. The following rheological properties were then measured at room temperature.

	Mud 4	Mud 5	Mud 6	Mud 7	Mud 8
P.V.	43	44	30	36	35
YP.	13	15	9	10	15
Gels					
10 Sec.	6	6	3	5	6
10 Min.	7	7	4	7	10
E.S.	552	268	450	392	223

In view of the above data, one of skill in the art would recognize that stable invert emulsion muds can be prepared utilizing various emulsifiers including those of this invention.

The above heat aged muds 4-8 were treated with 15 ml. of 17.5% hydrochloric acid solution. After mixing for 10 min. the following data were obtained.

	Mud 4	Mud 5	Mud 6	Mud 7	Mud 8
P.V.	22	27	31	to	30
YP.	1	1	9	thick	8
Gels					
10 Sec.	2	1	9	water-wet	3
10 Min.	2	1	8	Barite	2
E.S.	5	7	6	<u>6</u>	216
Comments	Water-wet	Water-wet	Water-wet	Water-wet	Oil-wet

In view of the above data, one of skill in the art would realize the following: mud formulations 4-7 with amine surfactant of the present invention converted to oil-in-water type emulsions when treated with acid; mud formulation 8, which is representative of a conventional drilling fluid remained a water-in-oil type emulsion. These conclusions are supported by reviewing the electrical stability data in which the single digit values of mud formulations 4-7 indicate a water continuous phase. In contrast, the electrical stability data of mud formulation 8 having a value of 216 indicates that the oil remains the continuous phase.

Treatment of formulations 4-7 each with 5.0 grams of lime and stirring for 10 min. converted back to water-in-oil type emulsions. The following are the electrical stability and rheological data of formulations 4 - 7 after such treatment:

	Mud 4	Mud 5	Mud 6	Mud 7
ES.	585	523	123	352
P.V.	65	59	-	35
YP.	24	16	-	16
Gels				
10 Sec.	5	4	-	6
10 Min.	7	5	-	9

One of skill in the art, upon review of the above data should appreciate that upon protonation of amine surfactants of this invention the water-in -oil type emulsion fluids can be converted to oil-in-water type emulsions. In addition, upon deprotonation of the protonated amine surfactants the oil-in-water type emulsions can be reconverted into water-in-oil type emulsions.

Example-3

The following demonstrate the utility of amine emulsifiers of this invention in combination with other emulsifiers.

Formulations

Material	Mud 9	Mud 10	Mud 11	Mud 12
IO-C ₁₆ -C ₁₈	125	125	125	125
Lime	2	2	2	2
Organoclay	4	4	4	4
EthomeenT/12	10	10	8	6
Wetting Agent	Emphos PS2227	VERSAWET	NOVAMUL-3, NOVAWET-1	Monamide - 150ADY
	1.5	1.5	1.5	4
Brine 25% CaCl ₂	90	90	90	90
CaCO ₃	291	291	291	291

In the above table the terms and abbreviations are the same as in previous examples. In addition, the terms VERSAWET is a oxidized crude tall oil available from MI Drilling; NOVAWET is a wetting agent available from MI Drilling; Monamide-150ADY is available from Mona Chemicals; and all other components are technical grade chemicals commonly available.

Mud formulations 9-12 were prepared in a manner described above in Example 1.

After recording the initial electrical stability of mud formulations 9-12, the muds were heat aged at 250°F/16 hours. The following results were obtained on these mud formulations:

	Mud 9	Mud 10	Mud 11	Mud 12
Initial E.S.	396	377	368	277
Heat Aged E.S.	525	375	310	350
P.V.	66	57	55	62
Y.P.	8	15	16	9
Gels				
10 Sec.	6	7	6	7
10 Min.	6	8	7	7

To the resulting muds, 50% by volume of water and 10 g of glacial acetic acid were added and the mixture stirred for 10 min. The electrical stability value for each sample was six or less. In addition the muds were dispersible in water indicating that water was continuous phase.

Given the above results, one of skill in the art should realize that invert emulsion drilling fluids can be prepared utilizing the amine surfactants of this invention in combination with other conventional surfactants. In addition, these fluids can tolerate the addition of common contaminants and can still be converted from water-in-oil type emulsions to oil-in-water type emulsions upon protonating the amine surfactants.

Example-4

The following mud formulations were prepared to demonstrate the use of different oleaginous materials using the amine surfactants of the present invention.

Formulations

Material	Mud 13	Mud 14	Mud 15	Mud 16
Oil	LVT-200	dioctyl carbonate	Diesel	Sarapar-147
(gm)	(120)	(120)	(120)	(120)
Lime	1.0	1.0	-	1.0
VG-PLUS	2.0	2.0	2.0	2.0
Ethomeen T/12	12	12	12	12
25% CaCl ₂ Brine	190	190	190	190
CaCO ₃	66	66	66	66

In the above table the terms and abbreviations are the same as in previous examples. In addition the terms, LVT-200 is a mineral oil available from CONOCO Oil Co. dioctyl carbonate is available from Huntsman Chemical; Sarapar-147 is a paraffin hydrocarbon available from Shell Oil Company (Singapore); and all other components are technical grade chemicals commonly available.

The above muds were made in accordance with the procedure given above in Example 1.

The following initial rheologies were measured at 120°F.

1

	Mud 13	Mud 14	Mud 15	Mud 16
ES.	229	512	239	313
P.V.	21	53	41	34
YP.	16	124	31	7
Gels				
10 Sec.	8	60	13	4
10 Min.	8	61	17	5

2

3 The above mud formulations were heat aged at 150°F/16 hours. The following
4 rheologies were measured at 120°F.

5

	Mud 13	Mud 14	Mud 15	Mud 16
ES.	279	35	299	245
P.V.	27	thick	45	29
YP.	10		32	8
Gels				
10 Sec.	6		15	6
10 Min.	7		17	7

6

7 The above mud formulations were treated with 10 ml of 17.5% hydrochloric acid
8 solutions. The electrical stability of each formulation dropped to six and became water
9 dispersible. One of skill in the art would readily appreciate that this information
10 indicated that the initial water-in-oil type emulsion formed was converted to an oil-in-
11 water type emulsion upon the protonation of the amine surfactant.

12 Upon treating with 4.0 ml of 50% sodium hydroxide or 5.0 g of lime, the above
13 acid treated mud formulations converted back from being oil-in-water type emulsions to
14 water-in-oil type emulsions. The electrical stability of these alkali treated muds were as
15 follow:

16

	Mud 13	Mud 15	Mud 16
E.S.	552	543	512

17

18 Upon treatment with either hydrochloric-acid, acetic acid or lactic acid, the fluids
19 converted to oil-in-water type emulsions with electrical stability of six. Treating the acid

1 treated emulsions with 4.0 ml of 50% sodium hydroxide, converted the oil-in-water type
2 emulsion into a water-in-oil type emulsion with E.S. of 500, or greater.

3 One of skill in the art should appreciate that the above results indicate that various
4 types of oleaginous materials can be used to formulate invert emulsion fluids of the
5 present invention. In addition, these invert emulsions can be converted to regular
6 emulsions and back to invert emulsions by protonating and deprotonating the amine using
7 various water-soluble acids and base.

9 Example 5

10 To demonstrate the utility of various acids in protonating the amine-surfactant of
11 this invention the following formulations were prepared.

13 Formulations

Material	Mud 17	Mud 18
Sarapar-147	120	120
Lime	1	1
VG-PLUS	2.0	2.0
Ethomeen-T/12	120.	120.
25% CaCl ₂ Brine	190	190
Emphos-PS-2227	0.8	-
VERSAWET	-	2.20
Barite	66.	66.

14
15 In the above table the terms and abbreviations are the same as in previous
16 examples.

17 The above muds were made in accordance with the procedure given above in
18 Example 1.

19 The above formulations were heat aged at 150°F/16 hours. The following
20 rheologies were measured at room temperature:

	Mud 17	Mud 18
E.S.	380	470
PV	26	26
YP	12	9

Gels		
10 sec.	6	5
1- Min.	6	6

The above mud formulations were further heat aged at 250°F for 16 hours. The following is the rheologic properties at room temperature:

	Mud 17	Mud 18
E.S.	606	750
PV	33	30
YP	9	11
Gels		
10 Sec.	4	4
10 Min.	5	5

Mud 17 was treated with 6 g. of solid citric acid. After 1.5 hours of mixing the electrical stability was measured and had a value of six. One of skill in the art should readily appreciate that such a low electrical stability value indicated that the previously formed water-in-oil type emulsion mud was converted to a oil-in-water type emulsion mud upon the addition of the citric acid.

Mud 18 was treated with 6.0 g. of glycolic acid. After a thorough mixing the electrical stability was measured and had a value of six. One of skill in the art should readily appreciate that such a low electrical stability value indicated that the previously formed water-in-oil type emulsion mud was converted to a oil-in-water type emulsion mud upon the addition of the glycolic acid.

Upon treatment with 5.0 g. lime or 4.0 ml of 50% NaOH both the formulations converted back to water-in-oil type emulsions each having an electrical stability of 608 and 808 respectively.

Example-6

The following formulation was prepared to demonstrate the utility of amine emulsifiers of this invention in making higher mud weight formulations using barite.

Formulations

Material	Mud 19
IO-C ₁₆ -C ₁₈	147.6
Lime	2.0
VG-PLUS	4.0
Ethomeen-T/12	10
Emphos PS-2227	1.5
CaCl ₂ Brine 25%	106
Barite	276

1

2 In the above table the terms and abbreviations are the same as in previous
3 examples.

4 The mud formulation was prepared in a manner described above in Example 1.

5 The following rheologies were measured at room temperature before and after
6 heat aging at 150°F for 16 hours.

7

	<u>Initial</u>	<u>Heat Aged</u>
E.S.	632	525
P.V.	40	45
Y.P.	6	7
Gels		
10 Sec.	5	5
10 Min.	6	7

8

9 Upon treating the above formulations with 10 ml 17.5% hydrochloric acid the
10 electrical stability dropped to 6. The mud was too thick to measure the rheological
11 characteristics. The heat aged mud was found to be water-dispersible. One of skill in the
12 art should readily appreciate that such a low electrical stability value and the water-
13 dispersible characteristic of the heat aged mud indicate that the previously formed water-
14 in-oil type emulsion mud was converted to an oil-in-water type emulsion mud upon the
15 addition of the acid.

16 Treatment of the mud/acid mixture with 5.0 g. lime converted the oil-in-water
17 type emulsion back to a water-in-oil type emulsion as evidenced by the measurement of
18 an electrical stability of 189.

19

20 Example 7

The following formulations were prepared to demonstrate the utilization of fatty acid ester and dialkylcarbonate as oleaginous material in preparing the mud formulations of this invention.

Formulations

Material	Mud 20	Mud 21
Fina Green	188	-
Mixed dialkyl carbonate	-	188
Lime	1.0	1.0
Organophilic Clay	2.0	2.0
T/12	12.0	12.0
25% CaCl ₂ Brine	98	98
CaCO ₃	76	76

In the above table the terms and abbreviations are the same as in previous examples. In addition the terms, Fina Green is a fatty acid ester available from Fina Petroleum Corp.; Mixed dialkylcarbonate is a mixture of aliphatic dialkyl carbonates available from Enichem Chemicals; and all other components are technical grade chemicals commonly available.

The mud formulations were prepared in a manner described above in Example 1.

The above formulations, mud 20 and mud 21 were heat aged at 150°F for 16 hours. The heat aged rheologies were measured at 100° F.

	Mud 20	Mud 21
E.S.	884	645
P.V.	89	53
Y.P.	37	18
Gels		
10 Sec.	22	10
10 Min.	27	14

The above mud formulations when treated with 10 ml of 17.5% hydrochloric acid, electrical stability values dropped to 18. Both mud formulation were water dispersible. One of skill in the art should readily appreciate that such a low electrical stability value

1 and the water-dispersible characteristic of the heat aged mud indicate that the previously
2 formed water-in-oil type emulsion mud was converted to an oil-in-water type emulsion
3 mud upon the addition of the acid.

4 Upon treatment with 5.0 g. of lime both mud formulation became water-in-oil
5 type emulsions as evidenced by the oil dispersible character of the emulsions and
6 electrical stability values of 485. One of skill in the art should appreciate that the above
7 demonstrates that the water-in-oil emulsion character of the originally formulated invert
8 emulsion was restored by the addition of the lime which deprotonated the amine
9 surfactant.

10 While the compositions and methods of this invention have been described in
11 terms of preferred embodiments, it will be apparent to those of skill in the art that
12 variations may be applied to the process described herein without departing from the
13 concept, spirit and scope of the invention. All such similar substitutes and modifications
14 apparent to those skilled in the art are deemed to be within the spirit, scope and concept
15 of the invention as it is set out in the following claims.
